The Othermill started as a DARPA grant researched at Otherlab. They wanted a cheap, long-lasting, and easy to understand CNC for every classroom, something with the same capabilities as a laser ...

The Othermill Is Something Else

Perhaps a computer numerically controlled (CNC) lathe, mill, or even a laser cutter—anything that would add to the vocabulary of tools and techniques that we're starting to build at home.

Making education and career connections.

Wood as an engineering material can be technically defined "as a hygroscopic, orthotropic, biological, and permeable material having extreme chemical diversity and physical complexity with structures, that vary extensively in their shape, size, properties and function". Therefore, using wood to its best advantage and most efficiency in engineering applications, specific characteristics or chemical, physical and mechanical properties must be considered. The products are divided into two classes, solid wood and composite wood products. Solid wood includes shipbuilding, bridges, flooring, mine timbers, etc. Composite wood products include insulation board, plywood, oriented strand board, hardboard and particleboard. In recent years, the machining of wood products has acquired great importance due the short supply of wood and increasing environmental awareness among users and manufacturers. The optimization of the machining process centers around the mechanism of chip formation, tool wear, workpiece surface quality, crack initiation and propagation of different types of wood. Other factors are also humidity, temperature, static preloads, and vibrations that can affect the wood during the machining process. The book provides some fundamentals and recent research advances on machining wood and wood products.

A rich devotional guide that shows the unfolding of the revelation of the person and work of Jesus Christ in the Pentateuch. Has provided precious spiritual help for four generations.

Provides up-to-date, comprehensive coverage that establishes minimum regulations for building systems using prescriptive and performance-related provisions.

When Dink, Josh, and Ruth Rose visit Plymouth, Massachusetts for Thanksgiving, they uncover a mystery that dates back to the landing of the Pilgrims.

Addressing the use of robots for flexible automation from a manufacturing systems viewpoint, that is how robots interface with all the manufacturing hardware and software, this text discusses industrial applications and weaves a major case study throughout, allowing students to follow and join an automation design team as they work through each stage of the design process. An accompanying disk and

video provide project data. This third edition expands the number of well-documented manufacturing cases and applications, and adds a chapter on-work-cell design based on computer-integrated manufacturing (CIM) principles.
